

NY Session Breakout

Range breakout + liquidity sweep + candlestick confirmation + EA rules

Educational notice: No strategy, EA, indicator, or candlestick pattern guarantees profit. Binary/short-expiry decisions are especially sensitive to timing, spread and execution. This material is a chart-reading and automation framework, not a guarantee of next-candle direction.

1. Strategy Identity

Trade a defined pre-New-York range and require a confirmed breakout or a separately tested liquidity-sweep reversal. Use one consistent timezone in both manual trading and the EA.

2. Range Breakout A-to-Z

1 — Define range

- Mark the high and low of the chosen Asian/overnight or pre-NY window.

2 — Map liquidity

- Mark previous-day high/low and equal highs/lows.

3 — Wait

- A wick through the range is not enough.

4 — Confirm

- Require a candle close outside the range, preferably with strong body/displacement.

5 — Retest

- Optional but useful: wait for breakout level retest and a confirmation candle.

6 — Entry/SL/TP

- Enter after confirmation; SL beyond invalidation; TP 1.5R–2R, measured range or opposing liquidity.

3. False-Break / Sweep Variant

High sweep → rejection back inside range → bearish confirmation = short candidate.

Low sweep → rejection back inside range → bullish confirmation = long candidate.

Treat this as a separate strategy in backtesting; do not mix statistics with the standard breakout model.

4. Binary-Style Candlestick Timing

CALL-style

- Range low sweep → reclaim → bullish engulfing/rejection close → directional decision only if every rule passes.

PUT-style

- Range high sweep → rejection → bearish engulfing/rejection close → directional decision only if every rule passes.

Short-expiry results are highly timing-sensitive and should not be presented as guaranteed.

5. EA Bot Blueprint

Session engine

- Convert broker/server time to the chosen session timezone.
- Build range once per day.
- Freeze range after the range window.
- Allow entries only during the NY window.

Breakout engine

- Detect candle close beyond range.
- Optional ATR/volatility filter.
- Optional retest requirement.
- Check news/spread.
- Place risk-controlled order.

Protection

- Daily loss lock.
- Maximum trades.
- Maximum consecutive losses.
- Maximum spread/slippage.
- Cooldown after stop-loss.

6. Backtest Metrics

Record range size, breakout time, direction, retest/no-retest, candle type, news proximity, result in R, maximum adverse excursion and maximum favorable excursion.

Evaluate expectancy and drawdown, not just win rate.

7. Final Checklist

Timezone verified; range fixed; previous-day levels marked; news checked; breakout candle closed; confirmation present; SL/TP defined; daily risk limit available.

Risk framework

- Risk 0.25%–1% per trade while testing; use a hard daily loss limit.
- Never use martingale or increase size to recover a loss.
- Define SL from market invalidation, not emotion; calculate position size from SL distance.
- Track expectancy, drawdown, profit factor, average R and consecutive losses—not only win rate.
- Backtest, forward-test on demo, then use small live risk.
